

Release 5.1

This release makes report delivery more reliable, gives generator records more flexibility, and clears out several bugs.

What's new

- You can now change the thermal resource and feedstock associated with an existing RTC.
- The Generation Pending Issuance flow now supports fuel split, and the fuels tab on generator registration includes a labels field.
- The audit transaction fee calculation now honors mid-year rate changes.

Improvements

- The Active Generators meter ID filter, the transaction details endpoint, and facility-name search on Transaction Details all load noticeably faster — 70 seconds to 4 seconds.
- Report download error messages now clearly explain when a link has expired or access is unauthorized.
- Organizations are now prevented from closing Market Purchased accounts while still associated to the market.
- Phone number validation now accepts 9+ digits to support international registrations.

Fixes

- Issues with rollback, generation injection receipts in RTC, calendar pickers on the Generation form, adjustments for meter and fuel splits, and the date filter on transaction details are all resolved.
- Cleared up the duplicate date fields on eligibilities, the Fuels tab access error, missing validation messages and the State/Province dropdown on Organization Registration, the QuickBooks org sync error, expired eligibilities being added to certificates, incomplete PDF table headers, the multi-account ART editing glitch, and a handful of smaller display polish items.
- Security and stability updates under the hood.
